

Handout 11.2: Homework Assignment 11.2 (This assignment is due in one week.)

Research an article about an earthquake disaster that was published in the popular press, from a book, from a technical journal or magazine, the Internet, or from elsewhere. The article must be at least five pages long and about something that involves earthquake response and recovery. The article must be about a specific case study (for example, response and recovery activities in a particular earthquake)

Read the article and identify and summarize the important issues related to earthquake response and recovery that are contained in the article, and list things you believe you should know about as a hazard manager. In other words, what in the article is relevant to the subject matter in this course and could help prepare you as a hazard manager.

Your summary should be approximately four pages, with two pages being dedicated to the response issues and an equal amount for the recovery lessons.
